EDITORIAL

Dave Middleton

It would appear that more and more people are getting into machine code programming, I receive far more machine code than BASIC. This leads to a problem. Machine source code by its nature tends to be very space consuming especially if it is going to be understood by others. I could of course just print a hex dump which can then be entered into the PET but this is unsatisfactory on two accounts. Firstly it is very difficult to understand both how the program works and even more difficult to change it so that it can be made to perform a different task. Secondly, a well documented assembler listing can help others, who do not have the expertise, to start to write machine code. I would welcome your comments on this; do I continue to give a large portion of the magazine over to machine code listings or would you be satisfied with hex dumps or BASIC loaders?

I am suprised by the lack of interest in the Pascal Users Group, is Pascal so time consuming or interesting for people who have purchased the language that they are now hidden away in dark corners gibbering quietly to themselves?

In the last issue of CPUCN there was an advertisement from 3D, (Digital Design and Development) who produce all sorts of interfaces and D/A equipment. The ad was on page 46 and had very poor quality reproduction, 3D were understandably annoyed and for this I apologise as the ad in no way represents the quality of 3D equipment.

I have published some of the letters which I have received and given my replies along with the letter. At least this way they get answered!

The cover shows the first prototype Mu-pet system being operated at Sheridan College. The Mu-pet is distributed in the UK by Kobra Microsystems.

All of us at Commodore wish dealers and users a Happy Christmas and a very prosperous New Year.

JOIN A FRIEND FOR CHRISTMAS!

Do you lend your copy of CPUCN to friends? Do you ever see it again? Would you like to see it again? Is it in the same condition? If the answers are yes/no/yes/no then why not give somebody a good present for the New Year, it's the same price as a cassette of games software but will give lasting enjoyment through the year and at the same time why not give yourself a copy of 'Best Of CPUCN', it contains all the information held in the first two volumes of the magazine and should be a real help to the beginner and expert alike. Just fill in the form below.

HOW MUCH DOES IT COST?

The subscription fee for the User Club is £10.00 for the UK and £15.00/year for overseas and you get free entry to the Commodore PET Show held once a year in London.

SPECIAL OFFER TO NEW PET OWNERS!

As a special incentive to new PET owners the membership fee has been reduced to only £7.50 for UK membership and £12.50 for overseas membership but you have to send us a photocopy of your purchase invoice and it must be received by us within 30 days of purchase.

HOW DO I APPLY FOR MEMBERSHIP?

Simply send a cheque/P.O for £10.00 for within the UK or £15.00 if you live overseas. Remeber you get a £2.50 discount if you send a copy of your purchase invoice. Any appropriate backdated issues will be sent immediately and thereafter you will receive subsequent issues at regular intervals.

Send your cheque to:-

COMMODORE NEWS

Dave Middleton

Commodore in Europe

The Commodore PET is Europe's leading micro computer and to demonstrate our commitment to Europe we are establishing a production facility in Braunschweig, Germany. It is going to be used for the manufacture of PETs and peripherals mainly for the European market. The new location in Germany was chosen after consideration of many factors including the reputation for building high quality technical products.

We are also considering the possibility of establishing a chip plant in Europe to complement the two chip plants we already have in America.

Commodore expands in Slough

The company is in the process of taking over part of another building next door to 818 Leigh Road. The Information Centre at Euston Road is going to be closed down and many of its activities moved to the new building along with the Training Department. The offices at 818 are already overcrowded so some of the departments will be moved to give more room generally.

The VIC has been released in Japan. Why Japan? It may be a surprise but Commodore is a truly international company with facilities in Germany, Hong Kong, Japan, Canada, England and of course the USA. Since a considerable amount of the development was carried out in Japan, it was appropriate that the product should be test marketed there. It goes without saying that the Japanese home electronics market is one of the most competitive in the world.

Communications News

The Commodore 8010 Modem has been released and will be available from your local Communications dealer. The modem allows PET to PET, or PET to mainframe communication and can originate or answer in full or half duplex mode. At present the modem is a fairly rare beast but it should be available in volume during the 1st quarter of 1981. The cost is £255.00 + VAT.

Having bought your modem you will now need software to enable your PET to talk to a mainframe efficiently. The software Communicator 1 allows the PET to communicate with DEC mainframes working with the VT52 interface standards, with asynchronous RS232 link at up to 4800

baud, allowing the PET to send or receive files. Communicator 1 costs £250.00 + VAT and is available for 3000, 4000 and 8000 series computers.

Comlink allows high speed communication via the IEEE bus using a set of efficient machine code routines directly from BASIC. For instance the command CONVERT will change PET ASCII to true ASCII. TIMEOUT is very useful in that it controls the length of waiting time between character receipt or transmission before the PET gives a 'timeout' status. Comlink will be available in the 1st quarter of next year and costs £200.00 + VAT.

Please note that only Communicator 1 is available 'off the shelf' at present but if you would like some more information about the latest communications products then please write to us at Commodore Slough asking for the 'Commodore Communications' leaflet, you will also be notified of your local dealer.

Also under development in the Commodore labs is a computerised cash register, no other details are available yet but it should be available in the second half of 1981.

The Commodore 8000 series PET

With the last edition of CPUCN you should have received a copy of 'Commodore News'. This contains a description of the new software available for the 8000 series machines. There are three management packages available for the PET these being THE ACCOUNTANT, which consists of 4 independent packages called: SALES CONTROLLER (Sales Ledger with up to 1200 accounts), PURCHASE CONTROLLER (Purchase Ledger, 1200 accounts), BUDGET CONTROLLER (Nominal Ledger, 600 accounts) and LINK which provides an automatic link between the sales/purchase ledgers and the nominal ledger.

COMMODORE APPROVED

Andrew Goltz

The "Officially Approved by Commodore" logo is appearing more and more frequently in advertisements in CPUCN, as well as commercial publications like PRINTOUT, PCW and PRACTICAL COMPUTING. But what does it really mean when a product is "Comodore Approved"? Let's follow the progress of a typical application for Commodore Approval and find out.

I will first ask the applicant to provide full written specifications of the product he proposes submitting for Commodore Approval. These are then considered in collaboration with Dave Briggs, Commodore's Technical Support Manager, and Dave Middleton who, as well as editing CPUCN, looks after "Approved" systems software and programmers' utilities.

If it seems likely that the new product is a significant enhancement to the capabilities of the Commodore PET, the applicant is then invited for an interview at Commodore, Slough. He is usually asked to bring the prospective Approved Product with him for demonstration and will have a thorough grilling on his company's finances, his proposed distribution and marketing strategy, as well as on the technical specifications of his product.

Quite a few would-be "Approved Products" "bite the dust" at this stage and in some cases the company concerned is recommended to collaborate with an existing Approved Product supplier in order to spread the costs of advertising and other promotional activities over more than one product.

If the applicant and prospective "Approved Product" survive the interview, the next step is for a number of the products to be sold to end users - and then to wait.

After a suitable period of time has elapsed, (this could be three months for new accounting software), the applicant is asked to arrange a visit to a number of end-user reference sites. These field visits play a crucial part in determining whether a product can really stand up to a harsh "real world" environment, is properly debugged and, in the case of accounting software, properly carries out the "month end" and "quarter end" procedures.

After the site visit, the applicant may be asked to carry out some modifications to the product, in which case he will be again asked to provide new reference

sites. However, if all goes well, the product is "signed up", contracts are exchanged and the new Approved Product takes its place in the next edition of Commodore's Approved Product catalogue.

The following new products have been Approved by Commodore since the last catalogue was published:

Visicalc

REVIEWS

Dave Middleton

A review of WordCraft 80

In the CPUCN 3.1 I gave a review of WordPro4 which has been written for the 80 column PET. In this issue I am going to give a review of WordCraft80. Both of these programs are very powerful and differ in their operation slightly. Both are Commodore Approved Products.

I will say at the outset that this is the first time that I have used WordCraft, CPUCN is normally produced with WordPro, the main reason for this being that WordPro was the once a Commodore product.

WordCraft comes on disk with a manual in a white ringbinder, the manual is very clear and consists of 83 pages. There is a protection device which plugs into the cassette port to prevent the purchaser from being able to duplicate the program for friends.

There are three modes of operation for WordCraft:-

Command mode where system controls such as disk initialisation, printing, getting text from disk and saving finished documents back onto disk are performed.

Control Mode where the user inputs the commands which are going to affect the output of the text. For example a command to start a new line or indent text.

With Type mode the user is allowed to create or modify a document in the PETs memory. The user has full cursor control and can move around the screen at will.

A very powerful feature of WordCraft is its immediate formatting. As the document is typed in it is formatted according to the instructions which the user has given it. As you can see this text has been written to a 40 column width. As I was writing it WordCraft took care of moving the word which exceeded the right margin onto the next line. This text is right justified but WordCraft will only perform this task when text is being output to the printer. A feature of WordCraft which is very unusual even on systems costing thousands of pounds is its ability to pan over a document which exceeds the width of the screen. This has obvious uses in laying out large tables. For example, say I wanted to lay out a table which has an output size of 100 columns, to perform this task on the 80 column screen would be a bit tiresome. The need for panning is greatly reduced with the 80 column screen but on the 40 column PET, for which WordCraft was originally written the panning facility can greatly reduce the strain on thinking out layouts.

WordCraft is orientated around pages and

chapters. This is ideal for long documents and books but for many applications this is too great a depth. The top of the screen is packed with information but I felt that it was mostly useless. You are given the documents name, the date it was created, the chapter file name and the chapter number. On the next line you get the cursor position, giving both the line and column numbers. Next to this is the page number and the number of pages in memory. The number of characters that are free and the disk drive that the chapter came from are the last items of information which are given. The next two lines are taken up with command and control mode inputs and error messages. The next line is used to give a visual indication of margin and tab settings which is probably the most useful of the five lines. I personally think that the loss of 5 lines from a screen with 25 lines is too much. Really most of the information should only be put onto the screen when it is required by the user and not be there all the time wasting space.

The program has a powerful search and replace facility which can be used both to look through the text for specific strings of characters and also be used to search and replace where necessary.

There is a function which can be accessed to set up the fifth line of the screen. This function is called Ruler. It allows the margins to be set by simply positioning the cursor at the desired margin setting and then pressing the 'greater than' key. Tabs are set and cleared in a similar manner. As an example of this functions power I will give a small demonstration:-

A margin can be set to any position and will remain at that setting until another setting is given. The margin setting used here is 10,40.

This has reset the margin width to 5,45. When moving through the text the margin settings move according to the embedded commands, a very powerful and well thought out feature.

Getting and putting files onto disk can be a fairly harrowing experience until the system is worked out. It took me about five attempts to get this text from disk but after a while it becomes easy. The difficulty arises from the fact that there are a great many options open to the user for controlling where the text is going to be put and what it is going to be called. To provide simple backup facilities the following command replaces the old version of text on disk with the latest version in memory:-

S,,,r

WordCraft does not make provision for scratching unwanted files. This is left for the user to do in immediate mode from BASIC. This is a bit suprising considering the depth to which the rest of the disk commands are controlled.

WordCraft has a very powerful form letter capability. As a test for this part of the program a simple form letter was written to try it out. I wrote the letter and at every point where I wanted information inserted I entered control mode and pressed ?. WordCraft then asks for a letter to be input, as soon as this has been done a tick and the letter appear on the screen in reverse field. This is a very powerful feature as it gives the capability of using the same bit of information in different parts of the letter. When I had finished the letter I saved it on disk. I then wrote what WordCraft calls a fill-file which consisted of names and addresses and saved this on disk. When I recalled the letter and gave the fill command the information was taken from the fill-file and displayed on the screen while being printed. The letters were printed as fast as the Spinwriter could handle them and I was very impressed by the ease with which it was all accomplished.

Comparison between WordCraft 80 and WordPro 4

These are the only two serious word processors available at present for the PET. Both are very powerful and have very similar functions but they tackle the various problems presented by word processing in different ways.

The best feature of WordCraft is its immediate formatting which all the professional, dedicated word processing systems have. It is this feature which gives the greatest differences between the two systems. When the margins are set with WordCraft the user types in text and when the right hand margin is exceeded the word is moved to the beginning of the next line. An obvious advantage of this is that the user does not have to take special care when editing with words which are split at the edge of the screen, as with WordPro.

WordPro only uses two lines of the screen to display information as opposed to WordCrafts use of five lines, it makes the screen seem far less cluttered and because the lines used by WordPro are not in reverse field the information is far less distracting.

WordCraft has a very comprehensive directory which may be useful in some circumstances but WordPro has the ability to call up documents from disk by using

the cursor to point to the name of the file. When the backslash is pressed the file is called up. As I pointed out in the review of WordPro the disk directory replaces the current memory content. This is annoying as BASIC4 has a command called CATALOG which prints the directory to the screen without having to load it into memory.

WordPro has a more powerful disk handling capability, a good example of which is to press the STOP key and then 'l' to initialise drive number 1. To achieve this with WordCraft means entering command mode then typing 'u,i,l' seven key strokes as opposed to two. I never had the time to examine WordCrafts filing capability deeply but it looks very powerful, with everything being stored as chapters of a document, this removed the need for the operator to have to worry about what page comes next. WordCraft lacks many of the disk handling capabilities needed for succesful housekeeping, it seems incredible that you have to go into BASIC to scratch files.

I found the embedded commands particularly difficult to master on WordCraft, especially when it came to delete them, a command is shown in the text by a reversed field. To display the commands held on a line RVS 'c' is pressed, some of the embedded commands appear on the screen as one character and have to be deleted by using another key, though there are only two cases where this occurs.

WordPro has what is called Insert mode. This is useful for editing text and making insertions. Text is input by the user and rather than deleting what is underneath the cursor it moves the text along as charcters are typed. WordCraft has a rather primitive system where by RVS 'inst' moves the text along by about 80 characters. Text is then input and when finished RVO is pressed and the unused space is deleted.

The two programs store text in different manners. WordCraft stores text sequentially and packs as much into memory as possible. WordPro stores text in 80 character lumps so if there is only 1 charcter on a line then 80 characters will have been lost from memory, this gives WordCraft a very large advantage in the amount of text which can be held in memory. When panning up and down through the text with WordPro it is actually memory which is being examined. This is why WordPro has the ability to pan through text very quickly. WordCraft has to format the text as it appears.

The standard letter capability of WordCraft is superior to that of WordPro in two respects. The fill-file is easier to write and the information is taken from disk rather than having to be resident in memory thus allowing far larger address files. Secondly, if, for example, you wish to personalise a letter

by having the recipients first name mentioned a few times, with WordCraft this is simple. All that needs to be done is to input the same identifying character throughout the letter and when it is printed the name will be taken from the fill-file and inserted at the different locations. With WordPro the name would have to be typed in for each location in the letter.

Which of the two would I buy? Both have ardent followers who proclaim the advantages of their system. To me WordPro is more user friendly but that may be because I have used WordPro ever since I joined Commodore. However, the command system with WordPro is easier to access using where possible only one or two keys. The main decision which the user will have to make is whether the text is to be formatted as it is input or if you are willing to allow it to be typed in with words being split on the right hand side of the screen and then only formatted when it is output.

KRAM Barry Miles

This package is a very interesting one, in that it successfully provides an alternative to the Commodore Random Access system, which is based on an advanced variation of the Indexed Sequential Access Method and is similar in action to the Relative Record system now available as part of BASIC 4 but with advantages. It enables a user to program random access and sequential access to files in a single operation, because although data is stored in random order, the system permits access to records in ASCII sequential order and another facility will retrieve them in the reverse order.

The search method used is efficient, so that data can be retrieved in between one and two seconds typically, with a worst case of about 2.5 seconds.

The user designs the file structure himself and the KRAM system is really a "Do It Yourself Database Kit", although a Mailing List program is included in the package, to act as a demonstration of the system and also containing subroutines for inclusion in one's own program. The system is operated by means of a number of machine code routines which are accessed by SYS commands, but rather cleverly, the commands have been designed to cause a degree of documentation, in that a key string must be set up before the SYS command is given and that key string must contain the KRAM keyword covering the action being carried out. e.g. If a database is being set up, the keystring must contain the word "Create"; if a record is being added, the keystring must contain "Add" and so on. Later versions will add these commands as additional BASIC commands, thus eliminating the need for the SYS commands completely.

Some care is needed at the planning stage to use the system most effectively, but the 40 page manual gives a great deal of help. A major element in the efficient use of the system is the ability to have up to five KRAM files open at once.

This enables you to use fields within a record to access other records in another file; thus avoiding waste of space by the unnecessary duplication of data in a number of records, or in extreme cases, in every record.

In order to give the system an adequate trial, I used it as an opportunity to set up a program for a problem which had been a headache for a considerable time. My disks were getting more and more full and I was in danger of never being able to find a particular program. The situation was becoming more acute, as wordprocessing and VisiCalc datafiles began to proliferate.

What was needed was a directory of directories, with the ability to access FROM the keyboard, data about any program, including the ID and name of the disk on which the required file was to be found. I also wanted to print out a catalogue of programs, sorted by category and in alphabetical order within categories. Using conventional sorting procedures was a problem because of the limitations of RAM space and of the inability to sort a disk full of data in one go.

Thus I had the opportunity to give KRAM quite a going over. The method used was to use WordPro to change a directory, by adding as a prefix to the filename the category of the file eg. "U" for utility, "G" for game, the number of the disk, (3 characters) and a quality code, which also identified sequential, WordPro & VisiCalc files, (one character). It would have been equally easy to use arrays to store the subsidiary data, but I wanted to test out the use of various KRAM files simultaneously.

The data was put into a continuous string of 21 characters and stored in a sequential file, pending its insertion into the catalogue, using KRAM, with the whole of the string acting as a Key. Any record could now be retrieved instantly, updated, or deleted. A formatter section of the program then printed out a categorised list, with the various codes indicated above translated into their significance.

The system works extremely well and various handy KRAM facilities emerged. If you cannot remember the full key for a record, you can use a partial key and then browse through the records in ASCII sequence until you find the one needed. If you attempt to add records which are duplicates into the KRAM file, the information is not duplicated. This was particularly useful in my application because a new version of the sequential

file of the data could be produced, updated by the addition of extra programs added to the disk and the data run through the KRAM input routine, knowing that KRAM would reject all but new records.

The package comes a a disk-based program together with the inevitable security ROM. It is not cheap, but if you can make use of its facilities, it represents good value for money and Calco Software, its U.K. distributors know all there is to know about the package and support it fully, even to the extent of sending out a newsletter to customers!

If you need even more sophisticated routines, then SuperKRAM is on its way and pending a review of that, let me just mention multiple keys and limitless numbers of files open.

Superchip Barry Miles

This ROM is advertised as a supplement to the Toolkit, with which it is fully compatible. It contains a large number of routines which should give something for everyone. For instance REPEAT, which can be set to your own choice of delay, speed of repeating, is a very pleasant aid. Some will question the value of the choices given but to my mind it can be aggravating if the repeat delay is too long, or the repeat frequency is too slow or too fast. It is worth remembering that the average reaction time is 7/10ths of a second and racing drivers react in 3/10ths. Slow for some is fast for others! Similar comments apply to the ability to type most of the common Basic keywords, by holding down The RUN/STOP key, (redesignated control by Superchip) and hitting one other key, usually the obvious one: e.g. "R" for Return. Some have said this is pointless, since the use of the initial letter and shifted second letter will produce the same result. I cannot agree with this however, because until the line is listed, you cannot tell whether the 80 character limit has been exceeded, nor can you read the code easily. At times it is helpful to exceed 80 characters, to produce compact programs and to make alteration of existing programs harder but normally clarity is much more helpful. The Superchip way is usually more satisfactory.

A RETRACE facility is provided which has considerable use in debugging. With this enabled, you may discover the last 10 lines executed before you broke into the program. The break will be caused by use of either a bracket key which Superchip redesignates "STOP", or by use of another facility: "HOLD", which stops everything, including the clock, until Return is pressed.

Screen-handling has been considerably enhanced, so as to provide many of the facilities of the 8032, some of them more readily accessible than on that machine! Erase begin, erase end, delete line,

insert line, scroll up, scroll down and even a window of up to 9 lines are all available. All these functions are available both from the keyboard and from within programs by way of SYS commands.

The greater ease of program editing provided by these facilities is likely to be much appreciated. For instance, having listed a number of lines, it is very pleasant to be able to create a line between two others and see exactly what it will look like, especially if you are using indentation to assist clarity.

ESCAPE will enable you to jump out of programmed cursor mode at will, using the obvious command "control quote ("). This prevents a large amount of frustration when seeking to modify strings. You can also toggle between graphics and lower case mode at will. Convenient if you cannot remember 59468, or whether "12" or "14" means lower case !

SHRINK is a very useful command, since it calls up a routine which immediately removes all remarks and unnecessary spaces from your program. This will enable you to save memory and speed up execution of most programs, in some cases dramatically. Some care must be exercised because if you have REMARKS which are the target of other statements (e.g. GOTO), these will be deleted. However, the routine is a considerable aid and it is not even necessary to store two versions of your program, one complete and one shrunk. The routine is so fast, that it is more convenient and cheaper, to shrink each program just before running it.

REVERSE used in a program will change all normal characters into reverse field and vice versa. The area of effect can be defined.

MOVIT will copy any area of ROM or RAM into any RAM area. (Although it does not relocate machine code, merely moves it.) If you wish to store screen displays for later recall, this does it for you.

It is possible to store a user-definable message in the first cassette buffer for display by direct call, or by means of a programmed SYS command.

Finally you may call up to 10 user-defined machine language routines, provided that you are not using the window scrolling routine.

The manual is very informative and the package is demonstrated on a disk or tape which will show you everything.

Very good value!

Incidentally, Toolkit for Basic 4, both 40 column and 80 column machines is now in the country and Supersoft tell me they had it first!

PETPACKS

Pete Gerrard

As promised earlier, a list of the new titles in the cassette library for this winter. Before going onto the new releases, there have been a number of changes to the existing catalogue, designed to improve the overall quality of the programs available from Commodore. A lot of the old titles have disappeared, to be replaced by an excellent set of new ones, to give you a truly superb selection of programs for your Commodore PET.

The following 20 titles are no longer available from Commodore :-

MP002, MP004, MP009, MP016, MP022, MP023, MP024, MP025, MP027, MP033, MP049, MP050, MP054, MP056, MP057, MP070, MP071, MP077, MP080 and MP081.

This is a rather drastic start to a review of the new releases in the cassette library! But rest assured, these new titles are better than ever! There are in fact thirteen releases this time around and they are as follows :-

| Order No. | Title | Retail Price inc. VAT |
|-----------|-----------------------|--------------------------|
| MP090 | Simulator #1 | 10.00 |
| MP091 | Physics Pack #5 | 10.00 |
| MP095 | Adaptive Kybd Trainer | 15.00 |
| MP096 | BASIC Aid | 10.00 |
| MP097 | Extramoon | 10.00 |
| MP098 | Lib. of Sub-Routines | 7.00 |
| MP099 | Labyrinth | 7.00 |
| MP100 | Laser Tanks | 7.00 |
| MP101 | Southern Hangman | 10.00 |
| MP102 | Northern Hangman | 10.00 |
| MP103 | Life | 7.00 |
| MP104 | Cosmic Jailbreak | 7.00 |
| MP105 | Crazy Balloon | 7.00 |

Also, we have new versions of two of the old programs in the catalogue, namely Linear Circuit Analysis (MP047) and Treasure Trove of Games #8 (MP052), which now consists of real time versions of Sorcerer's Castle and Jason and the Argonauts complete with sound effects (provided you have a sound output of course!)

Although descriptions of each of these programs can be found in the enclosed PET Pack and General Disk Library Catalogue, I'd like to say a little bit more about some of the programs.

Arcade Games

Laser Tanks, Crazy Balloon and Cosmic Jailbreak are the next three games in our Arcade series and carry on the grand tradition started by Invaders some 9 months ago. Unlike those earlier arcade games, these are home-grown products and are every bit the equal of their mainly

Japanese counterparts. Although it's difficult to say which one of these is the best of the three, it's Cosmic Jailbreak which has proved the most popular since its arrival at Commodore a short while ago.

You are in command of a space-ship, which can move across the bottom of the screen and which can fire lasers at the enemy above. You have three bases to hide behind, but it doesn't take long for these to be wiped out, both by yourself in a mad panic to get at the aliens and by the aliens as they aim at you. At the start of the game, the aliens are displayed in two vertical lines at either side of the screen and gradually they all start walking inward towards the centre. In the centre is a 'jail', made up of '#' characters, which is holding three aliens prisoner. The aliens are trying to free their trapped compatriots and your job is to stop them, shooting them down as they walk to and fro, gradually picking up and taking away pieces of the jail, getting ever nearer to their companions. All the time they're firing bombs at you and if one of them hits you, you've had it! Initially you start out with three 'lives', gaining a bonus life when you score 3000 points and another one every further 3000 points. There are two ways in which you can lose a life - one is by getting hit by a bomb, as we've said and the other is if the aliens actually manage to free one of their allies. From time to time a mystery space-ship will fly across the top of the screen and you can gain a random score by shooting this down - useful when you need a few more points to get an extra life.

If you look at the picture of Cosmic Jailbreak in the catalogue, you'll see a good example of some of what we've been talking about. The mystery space-ship is flying across the top, there's an alien on the left, walking back with a bit of the 'jail', an alien on the right has dragged one of his companions out of the jail and at the bottom of the screen you can see the display of your ship when it's losing a life.

One of the most appealing aspects of the game is the way it subtly becomes more and more difficult as you clear each successive screen of aliens and progress onto the next level. The level number is indicated in the top right hand corner of the screen and also on the bases - again, you can see this if you look at the picture in the catalogue. Occasionally you will get what is known as a 'runner' - this is an alien on a kamikaze mission, when all the others stop moving and he races back and forth, grabbing bits of jail until he gets his compatriot away to the side of the screen. You've got to shoot him, because he won't stop until

you do. On level one, all the other aliens stop when a runner appears. On level two, they still stop moving, but will carry on firing at you. On level three, an additional 'alien' appears, but not in line with all the others. This one can appear at any time (usually an inconvenient one!) and will appear immediately above your bases and will follow you across the screen, firing at you until you get him. On level four everything gets a bit more frantic. Level five and another set of aliens appear, this time six little ones, which also appear above your bases and run across the screen from left to right, firing at you all the while. If you manage to shoot all six of them, they simply reappear to make life that much more difficult. And so on to level nine - no other 'nasties' appear, it all just gets faster and more furious. After level nine (and incidentally, I've only seen somebody do this once!) you get a bonus of 5000 points and after the game starts again you're back at level six, only this time it's faster than ever.

A truly great game and possibly the most addictive one we've ever released. Write in with your highest scores and we'll keep track of them as the newsletters go by. The highest score we've got on Cosmic Jailbreak is 49,980 and that took about 40 minutes to do. If you get a higher score, write to me at the address at the end of this article and we'll keep publishing the highest scores in the newsletter. Incidentally, you can write in with your highest scores for all the other arcade games as well and we'll form a national league of games lovers. If somebody writes in with an amazingly high score, they'll be asked to prove it!

Basic Aid

Of the other releases, two of the most interesting are BASIC Aid and Adaptive Keyboard Trainer. Taking them in that order, BASIC Aid costs just ten pounds and is a set of programs that add an impressive number of extra commands (over 20) to PET's BASIC. Note that this will only work on BASICs 1 and 2 at the moment, although work is well in hand for a BASIC 4 version. The commands include such useful features as renumbering, block deleting, trace, auto line numbering, find, change, repeat, all the dos-support commands (plus a few extra!), merge and so on. The program occupies just 2 or 3K of your PETs memory (there are different versions, depending on whether you're using a disk drive or not) and can be relocated anywhere you like, so that it can work on any of 8, 16 and 32K PETs. Complete with instruction manual, this is an invaluable aid to any programmer. What else can I say - we use it all the time!

Adaptive Keyboard Trainer

The Adaptive Keyboard Trainer breaks new ground for Commodore. It is a touch typing course and can be used by people of all ages to teach themselves to type, on the PET keyboard and to type with all the speed and proficiency of a professional touch typist. The program is exceptionally well-written and comes complete with a manual, explaining a little bit more about how the program works. I've used it and my typing speed has increased considerably - it has to for articles as long as this!

On running the program, you're asked for a choice of alphabetic or numeric typing practise. Typing 'A' for alphabetic will then clear the screen and ask for a difficulty level (a number between 0 and 9). If this is the first time you've used the program, you should type in '0' and then you'll see a representation of the PET keyboard on the screen, with a symbol over one of the letters, indicating that this is the one to type. This symbol moves along as you type, jumping from letter to letter. Beneath the keyboard is a display of the letters you're being asked to type and ideally you should only look at those letters and not the keyboard in front of you or the one on the screen - it's the only way to learn to touch-type. If you'd selected numeric mode, everything would be the same, except you'd see a display of the PET numeric keyboard rather than the alphabetic one.

This is where the program comes into its own. As you're typing away, the program continually monitors your performance and only sends you onto the next difficulty level if your skill at the particular level you are on is good enough to warrant it. If it isn't, you stay on the same level. If you do really badly, you get dropped down a level until your skill improves again. Thus the program is constantly keeping an eye on your progress and responds accordingly.

This is the sort of program that could find many uses - programmers who are tired of spending hours typing listings in; people who simply want to speed up their typing; in schools for kids using PETs; as a professional touch-typing course, with some kind of multi-PET system and many other uses besides.

There are other courses planned, as the programs extend towards the 8032 graphics keyboards, the new VIC and so on. If you thought you'd never get used to all the different keyboards Commodore is producing these days, this and the other programs to follow, will provide the solution. All details will of course be published in the newsletter.

Before carrying on to the competition, I'd like to say something about the compatibility of various programs between

the different types of PETs. The introduction of BASIC 4 meant that a number of our programs and in particular the arcade series, had to be modified to run on these new 40 column PETs and I'm happy to say that all of the required changes have been made. Consequently, from receiving this newsletter, when all of the new releases will be available, all cassette products will work on BASIC 2 and 4, (with the couple of exceptions noted in the enclosed catalogue). Where a program (like Invaders for instance) requires three different versions to run on all the PETs, we are just supporting the two most current BASICS, namely 2 and 4.

In order to forestall a number of telephone calls, we are currently NOT planning to release any cassette products for the 8032, but instead are concentrating on producing the best available material for the 40 column

PETs.

And so on to the competition. First of all, thanks to everybody who has sent in a program so far. I seem to have sparked off a lot of creative genius! Since this has proved so popular, I'm going to extend the closing date until we go to press on the next issue. This gives any of you who haven't sent anything in so far a last chance - you've got about three weeks to get those programs in! I'll detail all the winners in the next issue.

Send your arcade high scores and any programs you've written, to :-

Guten Topps der Morninks

Ich haiffen readen der Brief in die PET doggies magazinens von Folume Drei (nummer eins) entitled "Achtung Alles Lookenpeepers".

Der importantness muss stressed be. Die instructions und Befehlungsweisen in diesen Brief to be taken mit seriousness must. I, of the Englisch speaking perfect am, muss zu meine Kameraden in ze Computers Game einen Warnung given. So bitte to be der close attention giving!

Das "PET doggies good-boy pat-pat" Maschinen is wie gesagt einen Complizierten instrumenten der high Technik. Aber das BASIC der food of the "PET doggies good-boy pat-pat No! it's not walkies times" ist relatively (Ach! - der Einstein everywhere gets!) simpel. Aber (und hier der Warnung fuer Beginning peoples ist) nicht so easy der Filing handlings ist.

I therefore already hoping am that all peoples not mit der Fingersgepoken but especially already that the peoples of the clever knowing how to do it types in respecten of the "PET doggies good-boy pat-pat No! it's not walkies time - sit! play dead!" maschinen their knowledge pass on will in understanding easily articles.

Mit Spitzensparks Blinkenkights

Ich bleibe Hochachlungs voll

Herr K one over the eight.

P.S. Dr. Who has copyright on K9!

Save yourself £23.00!!!!

A common equipment failure noted on Training Courses is caused by the PET-BIRO interaction.

During the high fervour encountered on a course the biro wanders, seeking the calm and sanity found only in the dark recesses underneath the PET.

The operator, now reaching the peak of his excitement, locates this errant pen and, in order to retrieve it, lifts the PET up and encounters nasty cracking sounds as the PET-IEEE cable connector attempts bravely to withstand the force.

The result of this scenario is one recovered Biro and one smashed and useless connector.

The remedy for this ailment is simple tip the PET on its side instead of its back!!!!!!!

Lo and behold you have just saved yourself £23.00.

John Collins inside a PET.

APPLICATIONS

PET Makes Prescriptions

An Ipswich doctor has been prescribing his practice with a PET micro computer system.

The system has been introduced to provide, what seems like, a foolproof method for dealing with patients' requests for repeat prescriptions.

Previously when patients rang in wanting 'repeats' they would be able to provide the receptionist with little more than the colour and shape of their drugs. This meant that the receptionist had to search through files, writing out their prescriptions in often illegible handwriting, for the doctor to sign and then sending it off to the patient.

It was also difficult to for a check to be kept on the amount of drugs that had already been supplied to a patient. However with the doctor's new computer system the patient simply keeps a record card with a code number and the drugs that are being taken written on it. When they want a new prescription it is sent in to the receptionist, the code number and drugs required are fed into the machine and a neatly typed prescription is produced.

The machine also prints out and stores information relating to the amount of drugs and the date on which they were prescribed.

Another advantage of the machine is that at the press of a button the doctor can find out how many people are on a certain

drug. This means that if some information should suddenly come through warning that a certain drug could be dangerous all the people on that drug can be quickly tracked down.

So far the doctor, who can not be named due to the strict rules laid down by the General Medical Council says that his PET has met with great enthusiasm from both colleagues and his receptionists.

The system has been on display at the Royal College of Physicians in London and he is hopeful that GP's across the country will adopt it.

The doctors story is all the more remarkable because he is not a qualified computer expert. He bought books on programming and taught himself how to use a computer which he bought at a shop.

"Using a computer to record information on patients and diseases is something I had been thinking about for many years", the doctor explained. "But I could not do any more about it because of the cost. When a computer came down within my price range I went straight out and bought one."

For more details about the package contact Patrick Dixon at Medicom, phone 01 579 5845.

The picture shows Mrs Lenna Astridge, a receptionist at the Ipswich surgery operating the system.

1. More on program formatting!

Regular readers of this column and the PRINTOUT column which preceded it will have noticed that I put great emphasis on a neat and organised layout for programs. The reasons for doing so are well summed up in a most useful book from Addison-Wesley written by John Nevinson and called "The little book of BASIC style". Not that the book is little, containing as it does 150 pages of valuable suggestions, supported by plentiful diagrams and cartoons, on how to layout your programs.

The main point that he makes is that programs should be set out in much the same way as books or reports, with plenty of tabulation, blank lines and headings. If you were writing a report to be read by others, you would I am sure, break it down into numbered or lettered sections. Mr Nevinson suggests that time spent in formatting your programs in a similar way saves much more time in the debugging stage of program development.

My experience is that the effort spent on a typical Basic application breaks down as follows:-

| | |
|---------------|----------|
| Specification | 30 - 50% |
| Coding | 20% |
| Debugging | 50 - 30% |

Obviously anything that can be done to cut down the debugging effort is worth-while. I am absolutely certain that neatly formatted programs listed on a printer, with plenty of space between the lines, will help you significantly in reducing the time necessary to produce a robust working program.

The subjects in this issue of TEACH IN are discussed with that concept in mind.

2. Multi Digit Add (Assembly code program)

The Training Department have now run their first two very successful Assembly Code courses, with more on the way in the new year. The aim of the course is to get people to the point where they can create useful programs in machine code, using the full Commodore Assembler package or the Mini Assembler in that most useful utility, Extramon, which forms part of the Assembler package. Extramon is a slightly more advanced version of SUPERMON which is published and upgraded in CPUCN.

The problem with assembly programming is that once you have mastered the tools of the trade, and look around for applications, most of them appear to involve external devices with their own

complexities of coding, handshaking and timing protocol. I recommend to students that initially they look around for simpler routines which they can add to BASIC programs.

One or two examples written by students on the courses included:-

Sounding a tone blip, different for every key, each time a key is pressed. This could have some value for blind users. One student extended this to scanning each line on the screen and producing a different sound pattern for each character present. (Roll on, the Pet speech synthesisers).

Flashing the screen into reverse and back. This is an exercise done by every student in about the fourth hour of the course.

Moving a large pattern about on the screen much faster than in BASIC. One or two students extended this to moving the pattern over the screen contents, ie, once the pattern moved on, the original screen contents reappeared. One application might be in games animation: another in planning, where you might want to lay one diagram on top of another and later 'peel' it off again.

Searching a binary array created in a protected area above the top of BASIC. One application for this is the creation of your own Block Availability Map for Direct Access operations using DOS1. Another, which I used in a program analysing the PET show survey, found matches for a particular pattern of answers. E.g. "What percentage of replies put 'YES' for questions number 1,5,13,22,41,63 and 70 and 'NO' for questions 4, 12, 31 and 64"? In BASIC this takes ages, but using a short machine code routine, called by SYS, the search time seemed instantaneous.

As an example of what can be done I've taken a suggestion from the OSBOURNE/McGRAW-HILL book written by Donahue and Enger and entitled "PET/CBM PERSONAL COMPUTER GUIDE". In section 5, on page 190 onwards, they describe a way of performing arithmetic, using strings, which gives as many digits accuracy you need, up to 255 places, as opposed to Microsoft BASIC's nine digit accuracy. Those of you who have tried finding out what 2 to the power 235 is or what factorial 90 evaluates to will understand the problem. Some business applications require 12 digit accuracy.

The method involves holding the numbers

to be added as strings and performing the addition character by character, starting at the right-hand end. In practise this turns out to be noticably slow. It seemed a good candidate for turning into a machine code routine.

The method I used was to set up A\$,B\$ and C\$ as the first three variables in the variables table. That way, by looking at the start of variable pointers in locations 42 and 43, the routine can find the strings. Once the values to be added are assigned to A\$ and B\$, with the decimal points aligned in the same position counting from the right, the addition is performed as in the BASIC version. The program has to take account of any carry over from the previous digit, skip over the decimal point and adjust the result because ASCII values for the digits rather than absolute values are held in the strings. E.g. "123" is held as values 49 50 and 51 in successive memory locations. The result is placed in C\$. A listing for the BASIC program is shown below.

```

.: 033C 03 04 0A 0B 11 12 00 00

.: 03A4 03 95 00 CA 10 F8 60 00
.: 03AC 00 00 00 00 00 00 00
.: ?

```

The routine was developed using the full Commodore Assembler and once again proper formatting of the program helped the debugging process enormously. The source coding is shown below and I think that even those of you who are not too familiar with assembly code will still be able to follow most of the program through.

The final listing is a hex memory dump of the routine for those of you who want to enter the program using the monitor or BASIC DATA statements.

3. Vertical tabulations in listings.

Many of you will know how to indent lines of BASIC, to highlight nested FOR..NEXT loops for example. One way involves putting a colon followed by spaces at the start of the indented line. Another, invisible, method requires you to type any shifted character followed by spaces at the start of the indented line. When listed the shifted character disappears but the remaining indentation is unaffected.

It's also possible to obtain vertical tabulation, ie. blank lines on listings both to the screen and to the printer. Although the method may seem rather obscure, it saves quite a bit of memory that would have been used to hold characters highlighting the 'start of block' REM statements. I've been using a development of the original idea as published in the "Liverpool Software Gazette".

Job Opportunities with Commodore

Market Support

There is an opportunity for somebody to fill an interesting and varied position in the Market Support Department.

The applicant should be creative and have a good command of English. An ability to communicate technical topics as simply as possible is essential. The successful applicant would be responsible for producing, at regular intervals, a magazine, be involved with print buying and increasing links with user groups. Apply with C.V. to Andrew Goltz, Head of Market Support.

Junior Analyst/Programmer

1. Provide pre/post sales support for Commodore Business Software.
2. Assist with presentation of software and hardware.
3. Assist with the production of supportive sales and technical documentation.
4. The position is suitable for somebody who has an ability to work on their own incentive and who can communicate at all levels.
5. Apply to Mike Gross Niklaus, Head of Software Department.

All applicants should write to the person named above with full C.V. All applications will be treated in strictest confidence.

Please write to:-

Commodore Business Machines, 818 Leigh Road, Slough, Berks

The trick is to place a CHR\$(141) followed by two CHR\$(10)'s at the point in the program where you want a blank line to occur. (Ideally a CHR\$(13) would do the trick by itself, but apart from poking, I can't find a way of typing it into the program). The best place to put these characters is in a REM statement at the end of each program 'Block'. The way to do it is to type the line number, say 2099, then REM then two quote marks. Delete one of the quote marks, press REV, then shifted M, which will place a CHR\$(141) in the program line. Finally, two unshifted Js will create the required CHR\$(10)s. The original idea, in the LSG, suggested just CHR\$(141) which is the shifted return character. However, the Commodore printer needs the CHR\$(10)s, both of them, as well.

The listing of the BASIC part of MULTI DIGIT ADD includes a number of these REM vertical tabs in REM statements at 99, 2099, 3099, 4099, 5099, 6099, 7099 and 8099. To put them in, I typed in line 0099 REM etc, found all the header REM statements using the FIND facility in BASIC AID, then repeatedly edited the line number and pressed return. BASIC AID? you ask? More of that next time!

BUSINESS USERS COLUMN

Barry Miles

Some readers will not yet have purchased their machinery or having done so, will not yet have installed it in their business. Therefore some general observations about the pre-installation, installation and implementation stages will not be out of place.

It is worth remembering when considering these matters that computers are not everyone's idea of fun! As an enthusiast myself, I must admit that when there is a lot of work to be done on the machine, I dislike it as much as the next person!

What a business needs if microcomputerisation is to be a success, is enthusiasm for the innovation and a willingness to accept a period of teething troubles, with a belief in the success of the venture in the long run. It is apparent therefore that at least as much thoughtful consideration should be given to encouraging an environment to develop in which the installation of the system is welcomed as a beneficial innovation which will help the people concerned to maintain and improve their achievements at their jobs. It really comes down to a matter of motivation and conviction. These do not come easily if one simply presents staff with a fait-accompli. Many a new installation is likely to fail if the staff come in one morning and are told "We've got a microcomputer now and you're going to make it solve all our problems".

Most people placed in this situation will rebel and some may even promise themselves that it will never work.

The only safe way is to involve the people who are going to use the system in the decision-making process. Take those who are going to use the machinery to the computer shows; let them try various programs out for themselves and listen carefully to their opinions.

The current state of microcomputing is such that you really need at least one enthusiast in your office, who will get to know all the idiosyncracies of the equipment and how to get the best out of it. In particular, such a person will know what to do when things go wrong, as they may from time to time.

One way to ensure that you have such a person is to choose a bright member of staff and give that member a machine to play with at home. If you have chosen the right person your apparent generosity will be amply repaid by the fund of knowledge and really infectious enthusiasm which can be generated. It is

not generally appreciated by the unaddicted just how habit-forming playing around with computers may become. There are a number of people who program all night when they get carried away!

This is all to the good, when one considers the excessive expectations which can build up for the reliability of microcomputer programs.

It is a paradox that people using mainframe computers and paying hundreds of thousands of pounds for them, are quite accustomed to paying tens of thousands of pounds for software and having the producers produce updates of those programs, correcting errors and making improvements, at frequent intervals. Thus they expect the programs to be far less than perfect and to be constantly revised. The first-time microcomputer user, however, is probably accustomed to all the electronic equipment he has been in contact with, from transistor radios to hi-fi systems, working perfectly and consequently expects computer programs to be just as reliable. In fact, computer programming is a very exacting task. It calls for a rather unusual set of abilities in the programmer. Imagination to foresee whatever can happen and plan for it. Discipline to be able to plan a complex project and bring it to a satisfactory conclusion. Working with a machine which takes nothing for granted and must be told what to do. Where to find the information to work on and where to put the results. It is not surprising, in these circumstances that programs are not perfect, in fact what is surprising is how many amazingly effective programs are available for the machines at such low cost.

The usefulness of your in-house enthusiastic expert is that occasionally the machine will appear to go wrong, due to a slight anomaly in the way the program reacts to a situation unforeseen by the programmer and a knowledgeable operator will be able to remove the difficulty in a moment and be back in operation immediately, whereas the uninitiated will puzzle for some time.

It is now possible to sign up for a "hot line" to be available, enabling you to telephone once per day with any query about your installation. This can be a real time-saver in times of difficulty. Totally inexperienced users could sign up for more than one subscription!

It is worth considering how vital your machine has or will become to the operation of your business and to invest

in a service contract which will enable you to have your machine repaired in a very short time, perhaps with the temporary loan of other equipment if necessary. A more spectacular alternative is to invest in a spare system. This sounds very extravagant, but need not be so. You will tend to find that the abilities of the system are such that the suitable applications tend to multiply and you eventually run out of computer time for all the items you would like to put onto it. Also, there is the matter of staff training to be considered and the ability to use two machines at the same time for different jobs is not to be sneezed at. You may also find it useful to run trials of a proposed new program before committing yourself to its use.

To change the subject slightly; it will be readily appreciated that a loss of power during a computer run will cause you considerable aggravation and the need for a rerun of the work at present being carried out. (It will depend on how well organised your procedures are how much of a problem this will be for you and you should make sure that your dealer explains all about "back-up" procedures to prevent real inconvenience.)

Some parts of the country are subject to considerable fluctuations in mains voltages and in the continuity of electricity supply. If your area is one of these, you should very seriously consider installing a device for smoothing out the voltages and/or having a temporary battery supply which, if mains electricity fails, will enable the work being done to be closed down in an orderly fashion. These devices are not expensive compared with their time-saving potential.

One should consider the fact that the basic equipment is so cheap and the programs such bargains, that additional expenditure to make the life of the staff, who are the real users, a little smoother, is well worth while. This includes the provision of a satisfactory environment in which to use the machine: desks at the right height, proper typist's chairs, suitable lighting, well-designed stands to hold copy, appropriate storage facilities for diskettes and for binding and filing computer printout. These sound like comparatively unimportant matters, but they go a long way towards the happy acceptance of the new system and the contented working of the employees most closely involved.

It is important to make sure that no member of staff works too long at the machine in any one continuous period, or in one day. Short periods are the most effective, for both comfort and efficiency. It is certainly the case that there are varying degrees of tolerance to looking at the screen for long periods and short periods avoid eye-strain and the possibility of headaches.

It is very likely that the use of the system will cause a review of your business systems to be unavoidable and some change will prove necessary. Whilst the transition from other methods to the use of a computer should be as smooth as we can possibly make it, the design of programs will inevitably call for modification of how things are done at present. This is not necessarily a bad thing. Surely one of the worst reasons for carrying out a task in a particular fashion is "We've always done it that way". The review of systems which our computer now forces upon us may be a very good thing in giving an opportunity for a searching review into what is done, whether it should be done at all and if so, how it should be done. We may even find that the cost of the installation is recovered from the beneficial effects of this review, which is otherwise just the sort of thing to be put off "until we have time".

The likely outcome is that we are forced to rationalise our procedures and to put them into a logical order, with cross checks on accuracy as we go along. The fact that the computer is a rational logical robot, which does exactly what it is told, no more and no less, will have its effect. We will probably be forced to regularise ad hoc methods of dealing with exceptional situations.

It is always a problem to decide which applications to put onto your computer first. Perhaps you had a particular application in mind when buying the system, which is the best way to approach the selection of equipment. However a number of business men, convinced of the virtues of the microcomputer, buy a system with no firm idea as to exactly what it will be used for, but rather with a general feeling say about "Doing a bit of payroll and some accounting". We should appreciate that there are some applications which are highly suitable for the use of a computer and some which are not.

Fortunately the equipment itself is so cheap that it is comparatively easy for the investment to be justified by the use of a single program for a well-chosen application. It is possible to view all further applications as being cost-free (although some of my colleagues in the accounting profession may disagree on this method of cost allocation!). At least we may say, that at a time when average earnings exceed £6,000 a year, relatively small time-savings will pay for the system very rapidly.

For example, a number of payroll packages exist and you should be able to find one suitable for your application from amongst these. This raises the problem of how you set about ensuring that the program you buy for any application will prove to be suitable. The secret is not to buy the program as such, but rather to buy what it will do for your business. Approach your dealer with some sample data and do not ask for 'a payroll

program' and seek to evaluate it for yourself. Instead tell the dealer how many employees you have, how many pay rates, how many bonus schemes, how many pension schemes, how many savings schemes, how many different methods of payment (cash, cheque, bank credit transfer, National Giro cheque or transfer). You should also specify whether you require the program to generate a list of coins and notes required for cash payments. The \$64,000 question to the dealer is now 'Have you a program which do all this for me and which is capable of dealing with any foreseeable expansion in the numbers we employ'. The dealer will either be able to oblige or not. If he offers to write such a program in a few days, my advice to you is to go elsewhere, because this is far from being a trivial programming task!

Let us assume however that he offers such a program. Should we now buy it? Emphatically not; or at least not yet!. We must see it working. If the dealer is unwilling to demonstrate it for us, then, again, go elsewhere. The next stage is to persuade the dealer, not to demonstrate it, but rather to permit you, or better still, you and the member(s) of your staff who will be using the program, to try to operate the program. The danger of allowing the dealer to demonstrate is that there is always the possibility of the demonstration's accidentally glossing over flaws in the program which are likely to cause problems later!

You have brought the staff with you, not merely to encourage a feeling of consultation and involvement, but also for this next vital stage in the proceedings. You should imagine yourself to be testing the program for some Micro-computing Consumers Association, or acting like the Devil's Advocate when the question of whether a certain person should become a saint is being determined: You should look for all the possible ways of making the program malfunction. This involves trying to make every possible error in, say, half an hour, which you could reasonably expect to make in a year's normal operation. This is not suggested in any frivolous way, nor indeed in a mischievous fashion. The intention is entirely serious. Only in this way can you assess the likely outcome of using this program in your business.

It is extremely unlikely that the programmer will have managed to think of all the stupid things which you may be able to contrive to do when you are trying to be awkward!!: for instance taking a disk out if the machine tells you to ensure that you have inserted one, or deliberately putting it in the wrong drive; however you will be able to assess whether the program handles most likely errors and whether the ones that it cannot handle are such that you can live with them.

At this point you are able to buy the program, pausing only to make sure that changes in the Tax rules will be the subject of an updated version of it.

Job Opportunities with commodore

Computing opportunity!

This job is ideal for somebody who would like to enter the computing profession but lacks the qualifications to do so.

1. Age 18-25.
2. No previous experience is necessary.
3. You will be involved in the production of disk based software - this consists of, ordering raw materials, copying disks, assembling the product and keeping accurate records. You will also be responsible for scheduling the production.
4. You will also have control over revisions to existing software.
5. Apply to Mike Gross Niklaus, Head of Software Department.

Communications Product Management — A Major Opportunity

Commodore is planning to increase rapidly its activity in the communications field and will be recruiting additional staff to complement the current team. In particular a Senior Manager, reporting directly to the General manager, is required to take overall control of this area. Commercial as well as technical experience is necessary. This is an exciting opportunity with great potential. The salary is commensurate with experience. Apply directly to the General Manager, Kit Spencer, with a full C.V.

All applicants should write to the person named above with full C.V. All applications will be treated in strictest confidence.

Please write to:—

Commodore Business Machines, 818 Leigh Road, Slough, Berks

LETTERS

Dear Mr Middleton,

Many thanks for the disk copy of Adventure and your offer for financial help.

Our 'local' group covers a radius of thirty miles from Taunton in the south to Stow in the Wold in the north and we meet once a month.

The meetings are informal and generally consist of information swapping, solving machine code problems and generally anything we consider bringing up. Visitors are welcome but please ring first in case we have a space problem. All meetings are held at my home:-
23 Shepherd Haze, Wotton-Under-Edge (phone 2498), Gloucestershire

The date for the next few meetings are:-
December 19, January 30th, February 27th, March 27th. All on a Friday and all starting at 8.00pm.

We have many uses for our PETs including data logging, teaching, electronics, small business uses.

Yours sincerely,
Mrs Janet Rich

Editors comment:-

The financial assistance to user groups consists of a £25.00 handout, with no strings attached, from the Commodore PET User Club and the cheque will be winging its way to the Region 'B' IPUG within the next few weeks. There is only £250.00 pounds available which is going to be distributed in £25.00 sums. So user groups its up to you. Details of your clubs activities and number of members should be supplied and don't forget there is the superb disk based Adventure which is free as well to User Groups.

A letter from Jim Butterfield

SUPERMON Bug report:-

Versions 2 and 4 of SUPERMON may give trouble, particularly with the tiny assembler, due to an error in the coding.

To fix the bug type:-

```
LOAD"SUPERMON",8
?PEEK(1781)
```

If the PET returns a value of 26 then this confirms you have version 2. Now type:-

```
POKE1781,6
SAVE"@0:SUPERMON",8
```

This repair to SUPERMON is important; amazingly I've received no complaints and ran across the problem myself while showing somebody else how to use it.

Note on ADVENTURE: It's incompatible with some versions of the DOS wedge, if anybody has trouble running the program ensure that DOS is not loaded. I included a bootstrap program at the beginning of the ADVENTURE disk called ADVBOOT. This allows you to start up with LOAD"**,8 followed by RUN. I'm not sure what the nature of the problem is since ADVENTURE is 99% 'up-front' BASIC and does not use wedge techniques itself.

A recent discovery. If you somehow get an unclosed file (one with an asterisk in the directory), DO NOT SCRATCH IT. Get it out of the disk with a VERIFY (Collect). Scratching can potentially damage other files on the disk.

As long as I am on the subject of disks it is worth restating the two and a half major DON'TS on disk.

1. If you somehow try to write on a protected disk (write protect tab over the hole) do not do anything further until you power down the drives. Your protected disk will not be hurt but the system will very likely clobber some other disk. Turn the drives off and start again.

2. DON'T ever allow two disks with the same ID to be in the same work area. If you must do a backup (DUPLICATE command) get the other disk out of the work area - to another room, another building, another town. Serious trouble will occur to a disk's organisation if it is plugged into a drive that has been handling disks with the same ID. More backup disks have been ruined this way... and if you wreck your backups what do you do next?

- 2.5 Using @ for replacement of programs or files is still under a shadow. It seems to be OK on programs but shaky on sequential files. The cause is not known; trouble seems to strike at random and as far as I know is not reproducible. My personal suspicion is that it's associated with improperly closed files but that is only a guess. It would be best to steer clear of this (scratch or rename the old file) until the question is cleared up.

That all for now. Best regards,
Jim.

Dear Mr Middleton,

I was delighted to see in CPUCN that you are a Mechanical Engineer. I too am a Mechanical Engineer but if World War 2 had not intervened I would probably have ended up being an Electronics Engineer.

I bought an 8k 2001 series PET in the very early days and have been plagued by certain problems ever since. While I have learnt to deal with most of these, they do not go away and usually choose the most awkward moment to raise their ugly heads.

1) Since most of the problems reside in the ROMs the obvious solution would be to retrofit BASIC2 but I was quoted over 100 pounds, is this correct?

2) I am under the impression that the PET clears all RAM when powering up, why then do the cassette buffers contain garbage?

3) Why, when reading data from the 2nd Cassette does it sometimes stop reading leaving the deck running continuously?

4) I have expanded my RAM with a 'Petite', so I have 40k extending into the Expansion RAM area. Could I use this to upgrade a 3008N? I seem to remember reading that the memory expansion socket is not the same as on the 2001-8.

5) I believe that if I am to get disks I shall need BASIC2 ROMs. Is this true?

Finally I would add that Commodore really cannot expect dealers to answer questions like these. I have been in business long enough to know that if you want to survive, you must put your effort where the main chance is, which for a dealer is selling up to date hardware. However, for someone like myself who is not given to playing games with a machine and therefore uses the equipment almost solely for business purposes these are the sort of problems which are a real pain in the neck and if Commodore isolates itself from its customers and does not deal with them no-one else will, thus Commodore's reputation will suffer, which is presumably why the User Club was started.

Yours sincerely,
T.P.Gordon Brown

Editor replys:

The only reason I went into engineering was that it was something I knew about. It seems strange but only five years ago the only computers where big expensive mainframes and before I went to Polytechnic the nearest I had come to a computer was owning a Sinclair Programmable! Once at Poly I spent a vast number of hours programming, luckily the language I chose was BASIC. By the time I found that I was addicted to computers I was too far into the engineering course to make it worth while changing over to computer science. When I later put my

hands on a PET I lost my interest in the DEC mainframe instantly and when out and bought my own machine.

The 2001 series being the first generation machine was bound to have a few problems associated with it but as you point out these can usually be programmed around. Here are the answers to your questions.

1) The ROM retrofit for the 2001 to upgrade it to BASIC2 was to cost over £100 but it has been set at £38 + VAT to be the same as the BASIC4 retrofit.

2) The PET as part of its power up routine tries to write 170 into every memory location starting at 1024, when it does not read back 170 it assumes that it has reached the top of memory and sets pointers accordingly. The cassette buffers are below this address and are thus not affected by the power up routine.

3) There is a bug in the timing constants associated with data files. The answer was given in Volume 1 issue 1 and also in the 'Best of CPUCN' which costs £10.00 and will be available shortly as it is at the printers now.

4) You will need to change the socket but the Petite will work with a 3008N.

5) The ROMs are not included in with the disk system but will be given free if you ask for them.

Tel: (0204) 26644, 382741.

Dear Mr Middleton,

There are a few of points that arise from newsletter 2.8 which I have listed below.

1) I was pleased to read that I have won one of the 50 pound software prizes, as I already have most of the software in the Master Library, could I have a set of upgrade ROMs for my 3032 thus giving me access to BASIC4?

2) On page 8 Robert Oei points out a method of switching the printer to permanent lower case, thus allowing programs to be listed in lower case. He has highlighted a very serious bug that exists in the printer which appears only to be associated with ROM No 4, the latest ROM released for the printer.

This 04 ROM has an additional secondary address, number 7, which allows the user to switch the printer permanently into lower case, thereby avoiding the need for a cursor down at the start of every line. All that is needed is OPEN7,4,7:PRINT#7 and the printer will be switched. There appears to be no way to restore this mode to normal other than by switching the printer off and on again.

What Mr Oei has discovered is the fact that the flag that is set by the secondary address 7 is also accidentally set if, while a line of data is being printed under format control another formatted line is sent to the printer. The exact details are rather obscure and I am currently examining a disassembly of the ROM to try and find out where the problem arises. This bug can cause havoc if while trying to prepare formatted printouts the timing is such that one line is being sent to the printer at the same time as another is being printed thereby forcing all the output to be printed in lower case!

3) There is no doubt that the newsletter has come a long way since those early issues. However, I would like to suggest that items be delimited in some way. It is very difficult to identify where an item starts and finishes, making browsing through the newsletter almost impossible. Perhaps item heading could be in bold type while sub-headings remain in small type.

4) In CPUCN2.7 on page 2 there is a detail stating the undesirability of using the 'fast screen' POKE (ie. POKE59458,62) on the newer PETs. I have tried this on my new 3032 and found that the screen is reduced to only 20 scan lines (instead of 200) thus showing the first two and a half lines of characters. In addition, the interrupt appears to be speeded up significantly (about three times).

Looking at the circuit diagrams I can see there appears to be circuitry to perform such an operation. One wonders if this is just part of the address multiplexing or if it is something provided for future

expansion? A comment in the next newsletter would be welcomed by several readers.

5) Several sources have given details of the Jim Butterfield 'uncrash' technique of grounding the diagnostic pin and then performing RESET with a reset key. However, if a machine code program has crashed, very often the CHRGET routine at \$0070 is corrupted, so in addition to typing a semicolon and getting a question mark in reply type:-

.M E0F9 Ell0

Move the cursor over the address and type 0070/0078/0080 for each of the three lines, pressing return each time of course. This will restore the CHARGET routine to normal. Type 'X' and return to BASIC then type 'X' again which should result in the message 'SYNTAX ERROR' being displayed. This last step ensures that the stack pointer will be restored correctly.

This technique will allow recovery from machine code crashes more frequently than the straightforward Butterfield 'uncrash'.

Yours sincerely,
Mike Todd

Editors reply:

Thanks for the letter Mike, a few comments back:-

1) Yes, you can have the ROMs when they are available, it will be a few weeks yet before I can send them to you as the ROMs are arriving in 4032 PETs rather than as retrofits.

3) Vol 3.1 fitted in with your comments I think, I am continuing the process with this issue, if anybody has suggestions for improvements they are always welcome. Would contributors sending in files on WordPro please use the following page layout: lml0:rm50:jul:1fl with the same paragraphing style as shown in the rest of the magazine.

4) Do you want to know a really good way of causing permanent damage to your PET? Try POKE59458,62. What happens is, you get two chips, a MOS and a low power Schokty fighting each other. The MOS wins and the Schokty dies leaving the PET with only two and a half lines of characters! You have been warned!

Unfortunately there is nothing fantastic about the two data lines, Dave Briggs, Technical Support Manager says they are for address multiplexing.

BASIC PROGRAMMING

BASIC and DOS

Conventions

David Middleton

As a convention Old and New ROM PET was quite satisfactory but with the arrival of BASIC4 there are now three versions of Microsoft BASIC, this means that 'Old' and 'New' ROM is no longer sufficient to describe which BASIC is being used. I am going to use the following conventions and I would advise authors to do the same.

BASIC1 the original language, standard in 8k small keyboard PET, formally called Old ROM.

BASIC2 the version of the language in the large keyboard PET, 3000 series machines, formally called New ROM.

BASIC4 the version of the language used in the 8000 series PET and also in the 4000 series. Note that the difference between the 4000 and the 8000 series is in the screen editor and not the BASIC interpreter ie. the 4000 series has the same screen editor as the 3000 series. BASIC4 is available as a retrofit for BASIC2 machines.

Also it may now be necessary to describe which DOS you are using. I would suggest the following:-

DOS1 The version used in the 3040 disk units as standard.

DOS2 Fitted to the 4040 drives and supports relative records, available as a retrofit for 3040.

DOS2.5 Only available on the 8050 disk system. Disks are totally incompatible with the 3040 and 4040. Utilities are available to copy files from one disk system to another.

Remember that disks written on a DOS1 system can be read by DOS2 and vice-versa but no attempt should be made to write on a disk produced by the other DOS as corruption will occur in great proportions!

Hints on converting programs from BASIC 2.0 to BASIC 4.0 (40 column)

Paul Higginbottom

The best way I found to convert programs, was to divide all of the programs into four categories. These are as follows:-

1. Programs written entirely in BASIC,

with no PEEK, POKE, USR, WAIT or SYS statements.

2. Programs written entirely in BASIC, with PEEK, POKE, USR, WAIT and/or SYS statements.

3. Programs written partly in BASIC and partly in machine code, with PEEK, POKE, USR, WAIT or SYS statements.

4. Programs written entirely in machine code.

Firstly I would like to discuss the utilities I use when converting programs.

I use BASIC AID for the BASIC conversion. This has FIND, CHANGE (something the TOOLKIT lacks), NUMBER (renumber), KILL (to exit), DELETE, and BREAK (drops you into the monitor). This is a BUTTERFIELD abbreviation of our own BASIC AID, MP096 (now on sale for 10 pounds! and has 25 commands - I think), but for BASIC 4.0. Also I use SUPERMON4.REL (by BUTTERFIELD/WOZNIAK/SEILER/QUITE A FEW OTHERS) which is an add-on to the monitor commands for BASIC4.0, allowing you to hunt for code or text, disassemble, assemble, list memory in ASCII as well as hex, step through programs with trace or step, etc. I use a disk unit for conversion, but I should think a tape user could do the same sort of thing (ONLY SLOWER). The memory maps mentioned below have been published in CPUCN Vol. 3, Issue 1 and will also be published in 'Best of CPUCN' - Soon to be published.

Now I will go through each category, one at a time.

1. This category shouldn't need any conversion.

2. Let's take the POKE statements first. Apart from those used to alter the screen RAM (which stay the same), usually the corresponding locations from machine to machine can be found by looking at Jim Butterfield's memory maps. The only other problems that seem to arise, are when a location has been poked with a certain value to make the PET function in a different way. A good example of this is the well known one that will disable the RUN/STOP key. If you can understand why it works, then conversion to BASIC 4.0 is easy. All that is necessary, is to add three to the current contents of 144. On a 2.0 Pet POKE144,49 will disable the stop key. This is three more than its normal contents (46). Therefore POKE144,PEEK(144)+3 would work on either machine. Just to save you the bother, it is in fact POKE144,88 (to disable), and

POKE144,85 (to enable), on BASIC 4.0 machines.

If the program is entirely BASIC, then the USR and SYS commands will not be used (unless routines from the ROMs are being used). If ROM routines are being used, again memory maps are necessary.

The WAIT command is generally only used for keyboard activity: WAIT152,1 (wait for shift key), and WAIT158,1 (wait until bit 0 of the number of keypresses in the buffer is a 1; i.e wait until an odd number of keypresses > 0). The two just mentioned would be the same on 2.0 and 4.0.

The USR command would only be used if machine code was also used, but that is not covered in this category.

3. All hints made in category 2 should be observed for this category as well. The USR command uses bytes 1 and 2 as an indirect address to a machine code routine. The parameter in the USR command is 'floated' and put into the first accumulator. The address POKE'd into the bytes 1 and 2 will obviously not need to be changed but the actual machine code routines, will more than likely need to be changed. The routines most commonly used by USR routines are FLPINT (floating point to integer conversion for accumulator #1) and of course INTFLP (the other way round!). The corresponding locations can again be found in the Butterfield memory maps. Use FIND/POKE1/ to find the USR command set-up statements and work out the hex address. (See Dec to Hex conversion in this issue). Use SUPERMON to disassemble the USR code and make any changes on the screen (JMP's into ROM usually). You should also know where your program starts in memory. To find this out from a disk unit on a BASIC 4.0 machine, the following program will do:-

```
10 INPUT"FILENAME";F$:INPUT"DRIVE";DR
20 DOPEN#1,(F$),D(DR):IF DS THEN
   PRINTDS$:GOTO60
30 GET#1,A$,B$:N$=CHR$(0)
40 AD=ASC(A$+N$)+ASC(B$+N$)*256
50 PRINT"PROGRAM STARTS AT"AD
60 DCLOSE#1
```

You may want to add a little hex converter into the program.

To resave programs that do not start at \$0401/1025, you would need to drop into the monitor (SYS4 for example). Then you would need to see where your program ends by typing in .M 002A 002A <RETURN>. The contents of 002A,002B are the end of your program (LOW, HIGH). Let us say for example that:-

```
.. 002A 40 1B 40 1B 40 1B 00 00
```

appears. To save your program onto drive 0 on disk, you would need to type:-

```
.S "0:FILENAME",08,033A,1B41
```

033A is the start address.
1B41 is the end address (1 More than necessary, because the monitor does not save the last byte!)

4. Programs written entirely in machine code usually fall into three categories.

- (i) Those that use ROM entry points, and system variables all over the place.
- (ii) Those that only use system variables (keyboard usually).
- (iii) Those that manage everything by themselves.

As before, I will handle each case separately.

(i) Tiresome, because usually the whole program will have to be disassembled onto paper, and the listing gone through with a pen, whilst clutching memory maps!

(ii) Shouldn't be too much trouble, since most system variables are the same.
NOTE:- \$97 (151) = Keyboard Matrix coordinate on graphics keyboards,
= Unshifted ASCII on business keyboards.

(iii) Will almost certainly work. Only keyboard type may cause problems.

For the Xmas Stocking... ...available now

SPACEMAKER makes room for all those ROM goodies. Allows two Roms to address one Rom socket at the flip of a switch. £22.50 + Vat

KRAM Keyed Random Access Method (as if you didn't know!) for all Pets & CBM disks, 3000 to 8000. ! Now at 1981 price ! £75.00 + Vat

PRONTO-PET the hard/soft reset switch for 3000/4000 Pets. Gets you out of a crash, or clears the Pet for the next job without that nasty off/on power surge. Only £9.99 + Vat

For the New Year... ...pre-release news

SUPERKRAM is KRAM's Big Brother. Even faster & with MULTIPLE keyed access, unlimited open files and commands in Basic. £125.00 + Vat

COMMAND-0 is a 4K Rom for the 8032 with all the "Toolkit" commands (improved) + PRINT USING + soft key + program scroll-up + control characters on key & lots more. First deliveries at end of January. £50.00 + Vat

DISK-0-PRO Why throw away your Toolkit? This 4K Rom for the 3016/32 has all the 8000 disk commands and more + PRINT USING + repeat key + soft key + program scroll-up & lots more. Available beginning of January. £50.00 + Vat

We are sole UK Distributors for all these fine products. If your CBM dealer is out of stock, they are available direct from us, by cheque/Access/Barclaycard (UK postage paid).

Adding commands to BASIC

David Simons

Trying to add commands to BASIC is difficult and good knowledge of 6502 assembler language is required.

To add a command you need to know about the CHARGET (character get) routine which starts at \$70, the routine is used to scan BASIC lines and the first few bytes of it reads:-

```
;increment low source
0070 E6 77 INC $77
;new page ??
0072 D0 02 BNE $0076
;yes increment page counter
0074 E6 78 INC $78
0076 ;more code.....
```

It then continues to determine if the current character is a space or colon but all you need to know is the above. Quite simply you change it to a jump statement so if your routine starts at \$7700 then all you have to do is type:-

```
0070 4C 00 77 JMP $7700 ;Goto $7700
```

(4C is JMP in 6502 machine code). To set the start address to which the PET is to jump you can use the routine below:-

Any start address may be chosen for the enable routine below but remember to work out the address in decimal so you know the number to use with the SYS command. Remember if you are going to use a BASIC loader program you will not want to load separate areas of memory so the best approach is to put the enable routine (as below) before the routine for your new commands. The code shown below is relocatable anywhere, \$033A is the start of the 2nd cassette buffer.

```
033A A9 00 LDA #$00
;Load the accumulator with the
;low byte of the routine.
;Then store it.
033C 85 71 STA $71
;Load the accumulator with JMP.
033E A9 4C LDA #$4C
0340 85 70 STA $70
;Load the accumulator with
;high byte of the routine.
0342 A9 77 LDA #$77
0344 85 72 STA $72
;Return to BASIC.
0346 60 RTS
```

To use it type SYS 826, NEVER try to change the CHARGET routine using POKE - you will have to reset the PET if you do!! Don't try this routine until you have written your command(s) and saved a copy of them.

Once you have the PET going to your

routine you have to use a short piece of machine code to decipher whether the PET is meant to be executing the command or storing it in memory. This is achieved like this:-

```
;store x register
7F00 8E 3A 03 STX $033A
;transfer stack pointer to X register
7F03 BA TSX
;is the PET in edit mode?
7F04 BD 01 01 LDA $0101,X
7F07 C9 F9 CMP #$F9
7F09 D0 10 BNE $7F1B
7F0B BD 02 01 LDA $0102,X
7F0E C5 C6 CMP $C6
7F10 F0 09 BEQ $7F1B
;yes-increment the source by 1
7F12 E6 77 INC $77
7F14 D0 02 BNE $7F18
7F16 E6 78 INC $78
;go and see if it is a new command
7F18 4C 7F 27 JMP $7F27
;no-Get x register back
7F1B AE 3A 03 LDX $033A
;increment source
7F1E E6 77 INC $77
7F20 D0 02 BNE $7724
7F22 E6 78 INC $78
;get next byte.
7F24 4C 76 00 JMP $0076
;get ready to see if it is a new command
7F27 A0 00 LDY #$00
;Get current character
7F29 B1 77 LDA ($77),Y
;check to see if it is a new command.
7F2B C9 40 CMP #$40
```

We will stop the listing there for a while. What you have to do now is to decide what character you want to use as a start for your commands, there is not a big choice, these are the ones you can use @, !, ', &, [,], and \$. Once you have decided on a character at address \$772B change the 40 after C9 to hex of the ASCII of the character you have chosen.

The listing continues :-

```
7F2D F0 03 BEQ $7F30;
;Not a new command therefore
;jump to reget.
7F2F 4C 76 00 JMP $0076
;increment source low byte.
7F32 E6 77 INC $77
7F34 D0 02 BNE $7F38
;increment source hi byte.
7F36 E6 78 INC $78
;get new byte
7F38 B1 77 LDA ($77),Y
;see if it is the correct letter
;for a new command
7F3A C9 50 CMP #$50
7F3C F0 26 BEQ $7F64
;Not a new command goto reget
7F3E 4C 76 00 JMP $0076
```

You have to decide on a suitable character for your new command. Eg. if it inverts the screen a good letter would be 'I'. Place the hex of the ASCII of the

required letter after the C9 at the address \$7F3A. The jump at \$7F3E can be to \$0076 but if you have another command change the \$0076 to the address where that command starts. Then all you have to do is compare it with another suitable letter and so on.

Evaluating parameters.

Many commands need parameters and there are routines in the interpreter which can be used:

\$D675 - Returns the number in the x register, but if the number is greater than 255 it will print an error, so for numbers greater than 255 you must use the following routines : \$CC8B followed by \$D6D2

You will then find the low byte of the number in the y register and the high byte of the number in the accumulator.

\$D6CC - Returns the number in the x register, again if the number is above 255 use \$CC8B and \$D6D2. This routine will also return an error if no comma is put before the parameter.

\$F4FD - Evaluates a string. The string's position in memory is held in the x register (low byte) and the accumulator (hi byte). The length is stored in \$D1.

\$CDF8 - Checks for a comma, if there isn't one it returns a "?SYNTAX ERROR". Thus you can transfer as many parameters as you like to your routine.

Printing Results.

\$CA1C - Will print a string, the accumulator must hold the low byte of the address where the string starts and the Y register must hold the high byte. You must end the string with \$00 otherwise the PET will jam.

\$FFD2 - Will print the character held in the accumulator.

Getting Input.

\$FFCF - Will return one character (like GET) this character can be found in the accumulator. If no keys have been pressed it will return \$00.

\$FFE4 - Will do exactly the same as the above routine but will not display a cursor.

Zero Page.

For indirect addressing zero page is used, the following locations will not affect the PET; \$00, \$01, \$02, \$0F, \$10, \$21, \$22. \$21 and \$22 will not stay intact as some PET routines use them and remember do not use USR if you are using locations \$00, \$01 or \$02.

To Halt BASIC Execution

\$C389 - Will stop BASIC and display "READY."

In CPUCN Vol 2 Issue 8 a 'RESTORE DATA LINE' program was described. By using the program you find that the hi and low bytes of the line number you want have to be poked into memory but if we make this a BASIC command it can be used simply (ie you don't POKE in the line number but you just follow the command with the required line number). The listing below when added to the previous listing (\$7F00 to \$7F3E) will accomplish this task. For people without an assembler or who do not use machine code but want the command they should use the BASIC loader program at the end. See the BASIC loader program for instructions.

Data Restore Routine

7FB7 85 31      STA $31
7F9B A9 FF      LDA #$FF
7FBB 85 30      STA $30
7FBD 85 34      STA $34
7FBF 4C 89 C3   JMP $C389; Jump to READY.

```

Finally perhaps a few ideas....

The 2nd letter (ie the one that comes after the @,\$,etc) can be changed so that the number is a BASIC token. So you can have @RESTORE for the above program.

The CHARGET routine could be made to jump to a trace routine , step etc.

Never enable new command(s) without having made a copy on a tape or disk. This applies to all machine code programs as machine code has the habit of jamming the PET when not properly entered. If you don't use the 2nd cassette buffer you will have to protect your routine from BASIC. The best way of doing this is to put the machine code at the top of memory and then POKE 52,low of beginning of command(s) :POKE 53, high of beginning of command(s) and then repeat for locations 49(same as 53) and 48(same as 52).

If you have a command that will take a lot of machine code statements it is advisable to write the code needed, check it works, and then interface it to BASIC.

Formatting Listings

Dave Middleton

The idea for this program came from Mark Clarke while he was working for us at Commodore. One of the utilites which Mark wrote was for a program which would list another from disk without the program actually being in memory. The technique for getting a program to list from disk is fairly simple but I will give an indication of how programs are stored so that you can if you wish perform your own functions.

```

10 PRINT"HI"
20 END

```

The above program will be stored on disk in the following format:-

```

|001|004|011|004|010|000|153|034|072|073|
|START|LINK AD|LINE NO|?|"|"H|"I|
|034|000|017|004|020|000|128|000|000|000|
|NUL|LINK AD|LINE NO|END|NUL|NUL|NUL|

```

READY.

1. START: The first two bytes of the program stored on disk give the location of where it is to be put into memory (BASIC normally starts at 1025)

2. LINK AD: Points to the next link.

3. LINE NO: BASIC line number.

4. BASIC statement: Keywords have a value between 128 and 207

5. NUL: End of BASIC statement.

6. Repeat from No.2 until the link address is 0. When it is 0 this is the end of the program. Easy!

There is a two complications which are fairly simple to overcome. The BASIC keywords are saved as 1 byte tokens with a value in the range 128-207, a lookup table is used when converting these into a readable format for LISTing, for simplicity I use an array containing the keyword rather than using BASIC's lookup table. As everybody who used the screen editor knows, BASIC has a quotes mode which says that when ever quotes mode is on then every character received will be treated literally. Thus characters such as clear screen which has a code of 147 will be performed as clear screen and not translated into the keyword LOAD. Whenever a quote is encountered in a BASIC line a quote flag is set and then reset when another is found. The quotes mode is reset when a new line is started.

With the above information it is a fairly

simple task to write a program which will read data from disk and print it to the screen of the PET. I wanted to perform other tasks than this, notably getting the column width to be the same as the column width used for CPUCN. This gives other problems. If you key in the program and run it you will find that quotes appear at odd intervals on the left hand side of the screen or printer. The reason for this is that the quotes mode is switched off when ever a carriage return is executed. It is necessary to switch quotes mode back on again so that reverse field characters will be printed rather than executed. Remember that the Commodore 3022 printer will drop into lower case if a cursor down is recieved outside quotes.

A Story

The following program should provide a bit of fun, especially for the unsuspecting user. It is one of the programs from a set of four disks which Nick Green has in his possession for the Education Software Workshops, the disks will be available to bona-fide organisers only.

The program is obviously an attempt to get kids to learn grammatical terms and as such is quite successful but wrong answers can give even more hilarious results than the correct ones!

Hex/Decimal Conversion

In Volume 2 Issue 8 I published a Hex to decimal conversion program written by R Brand. I suggested that this could be shortened to six lines. I had considerable correspondence on this and some of the results were very good but nobody could match Paul Higginbottom who produced the following code with only four lines of BASIC.

```
100 INPUT A$:W=48:K=16:Q=LEN(A$):DEFFNT(  
T)=T+7*(T>9):IFASC(A$)<>36THEN120  
110 FORI=0TOQ-2:T=ASC(MID$(A$,Q-I))-W:J  
=FNT(T):V=V+J*K:I:NEXT I:PRINTV:RUN  
120 N=VAL(A$):PRINT"$":D=-LOG(N)/LOG(K  
) :DX=D-(D<>INT(D)):FORI=DXT00  
130 P=K↑(-I):QX=N/P:PRINTCHR$(QX+W-7*(Q  
X>9)):N=N-QX*P:NEXT I:PRINT:RUN
```

A program to convert machine code to BASIC DATA Statements

Dave Middleton

I wrote the following program to enable me to convert machine code into DATA statements so that BASIC can read the decimal number and then POKE it into the correct place in memory. The method used is one of the few examples where a self writing program is actually useful.

The program works out which version of PET BASIC it is using so that it can access the correct area of memory set aside for the keystroke buffer.

```
10 INPUT"INPUT OLD OR NEW TYPE ROM O/NMI  
 0000000":AN$:IFAN$="0"THENPE=1:GOTO40

IEEE-488 PET INTERFACES

| | | |
|---------------|--|---------|
| B200 | Bi-directional RS232C serial | £186.00 |
| Type C | Uni-directional RS232C serial | £120.00 |
| AP | Addressable parallel for Centronics or Anadex printers | £106.00 |
| GPI AP | Micro based bi-directional serial interface with buffering Custom GPI software development for special interfacing requirements | £249.00 |

All serial interfaces incorporate:

- Software or switched Baud rate selection with 16 different rates selectable
- Crystal controlled Baud rate
- Full RS232C handshake
- 20 mA current loop i.o. capability

All the above interfaces have two modes of code conversion to match print out to the PET screen for either display mode

| | |
|--------------------------|--------|
| Non Addressable parallel | £45.00 |
| TV/Video interface | £35.00 |

We also stock a range of PET connectors.

PET SOFTWARE

**TCL PASCAL
BASIC COMPILER
COMMUNICATOR** - Intelligent terminal package teletype, DEC VT50 emulation, runs on 80 column PETs
VISICALC
WORDCRAFT - Word processing software for 40 and 80 column PETs

NEW... MUPET

Multi user disk system allows 2 to 8 PETs to be linked together to share a CBM disk unit and printer: prices from £595 for a 3 user system.

RICOH R.P. 1600 Daisy Wheel Printer

- Printing speed - 60 C.P.S.
 - 124 character print wheel
 - Integral PET Interface
- Complete word processing systems - PET, Wordcraft, R.P.1600 also available**
Price R.P.1600 £1450 Inc PET Interface

ANADEX D.P. 9500/01 Line Printer

- Bi-directional printing with shortest distance sensing logic
 - High density graphics
 - 50 to 200 +
 - Parallel, RS232C and Current Loop
- Interfaces standard. PET Interfaces available.

Prices: 9500 - £895 9501 - £995

Full range of PET computers and peripherals

We can offer expert advice on scientific and industrial applications.

MACHINE CODE

DIMP Revisited

Danny Doyle

Among the ideas put forward for further experimentation, it was stated that BASIC images could be dynamically built, or 'canned', in any memory area for further processing by DIMP. This, unfortunately is not the case. In fact, any image to be processed by DIMP must reside in the BASIC input buffer, the start of which is at \$0200. The reason being that the firmware routine that DIMP calls to convert keyword tokens expects the image to be in no other place than BASIC's input buffer. Alas such is the way of software. So if, for example you are planning to give some canned BASIC images in your assembler program, you will need a small routine to block transfer them to BASIC's input buffer prior to processing them with DIMP.

One other point needs mentioning. The original version of DIMP, more by

accident than design, automatically handled multi-statement images such as:-

```
A$="BLA": B$="BLA": ?A$,B$
```

However, if you intend to replace the call to BASIC's input routine, line 5, by a call to your own image building code, you will lose the automatic multi-statement handling. No sweat, help is at hand. Listing 1 shows an updated version of DIMP which will take care of any multi-statement, regardless of the method used to place the image in BASIC's input buffer.

To finish, if you do substitute line 5 by a call to your own routine, remember that on return the X and Y registers must be pointing to the address minus one of BASIC's input buffer; ie. X reg. should contain \$FF and the Y reg. \$01.

A double density line plot routine

Dave Middleton

The PET normally can only plot to a resolution of 40 across by 25 down. This is obviously of little practical value and to compensate for this there have been quite a few programs for plotting on the screen using double density graphics. This brings the resolution to a more respectable 80 by 50 points. The routine I have used in the line plot has been taken from Nick Hampshires "The PET Revealed". I had a requirement for lines to be plotted using DDG so I wrote a BASIC program to draw lines from any two coordinate pairs. The only problem with using BASIC for something as repetitive as this is that it is terribly slow. Machine code is the answer and the program shown below is the result. The bit that does all the work starts at line 0076 and finishes at line 103, it is well commented and I leave it to you to work out what is going on, I would suggest working through a few example coordinates with pencil and paper as the easiest method for enlightenment.

I have also included a couple of BASIC programs which show routine in use. The program will work on BASIC2 and 40 column BASIC4 machines. To get it to run on the 80 column PET you will need to multiply the Y coordinate by 2 again at line 176 and alter the check in line 149. To get it to run on BASIC1 machines it will be necessary to change the zero page locations. I specifically located the routine at 7400 decimal so that BASIC1 users could load the code without having to recalculate the jump instructions. BASIC1 users will also have change locations \$B7 through to \$C2 so that the code does not trample on BASIC. I would suggest using the BASIC INPUT buffer (\$0A to \$59).
